

Cushion Tire Forklift Attachments

Cushion Tire Forklift Attachments - Cushion tires have a smooth profile on a firm tire with its tread being bonded to a steel ring to be able to shape the tire. The tire is pressed on the hub which is then affixed onto the truck. These types of tires are perfect to use in smooth floor warehouses and are obtainable in various rubber or polyurethane compounds.

Consisting of polyurethane, a poly tire is a very solid tire. These types of tires are used rather than cushion tires whenever there is a higher load capacity than can be obtained using a cushion tire and such applications which need a lower steering effort. Poly tires are in a variety of hardness ratings to meet various particular application needs. Narrow Aisle models and Orderpicker lift trucks would typically make use of small diameter poly tires for their outrigger load wheels.
