

Grapples for Forklifts

Forklift Grapples - Grapples work together with the crowning operation of the bucket cylinder positioned on the excavator. They can mount directly onto the jib or any quick hitch that is in bucket position. Grapples are most often meant for the processing and handling of construction materials, timber, domestic and aggregate waste items. The grapple's boxed design has additional support bridging. This particular manufactured design offers the grapple with maximum support and strength by way of preventing the body from breaking and turning through its operation.

All of the moving parts which encompass the grapple, together with the toes, are made out of hardened steel. The pivot points have been specifically designed in order to guarantee holding ability and supreme closing force. The operator has the capacity to handle all sizes and varieties of materials using the jaws built-in at the end part of the grapple with toes. This could enable the jaws to close through one another in a finger configuration for utmost handling capacity.
